

ROAD — Agent Technical Spec

Routine · Obligations · Availability · Dates. Set once at Relationship entry, referenced every week. Includes the availability calendar and travel (folded in, not a separate agent).

Scope note: "Availability calendar" was originally considered a 6th, separate agent. It's absorbed here — availability and dates are the A/D of ROAD and are meaningless outside that context. Fewer agents; same coverage.

1 · Responsibilities & boundaries

ROAD agent (LLM) does	It does NOT do
Guide the one-time R/O/A/D setup conversation. Interpret free-text obligations into structured calendar entries. Suggest date windows from open availability (never books one). Narrate travel-mode implications.	Persist calendar data (calendar service owns storage). Auto-book a date. Share anything without explicit per-entry consent. Re-collect ROAD weekly — it's set once and carried forward.

Hard boundary: the calendar service is the source of truth for all entries (availability, obligation, date, travel). The LLM reads/writes structured entries through the app layer — it never owns persistence, and it never sets an entry's `shared` flag on the user's behalf.

2 · The ROAD screen (in the app)

Mockup in the DREAM design system — routine, weekly availability, travel, and Guru's date nudge.

Four parts, one screen family:

- **R — Routine** → written to Stats (work, fitness). Set once.
- **O — Obligations** → recurring commitments as calendar entries.
- **A — Availability** → the week strip (busy / open / date-confirmed). Updated any time, shareable per-week.
- **D — Dates** → suggested by Guru from open availability; travel-aware.

Travel, the three modes

- **Solo** — visible only to the user (shown in mockup).
- **Partner solo** — visible to partner only if they choose to share.
- **Together** — jointly planned, both see it.

3 · I/O data contract

Input (from app layer)

```
{
  "user_id": "u_123",
  "mode": "setup | weekly_update | date_suggestion",
  "existing_road": { "routine": { "work": "9-6", "fitness": "gym_tue_thu" } }, // null on first setup
  "raw_input": "free text or structured form the user submitted",
  "calendar_window": [ // current week, from calendar service
    { "day": "Mon", "state": "busy" }, { "day": "Wed", "state": "open" }, ...
  ],
  "travel_entries": [ { "dates": ["12-22", "12-25"], "mode": "solo", "shared": false } ]
}
```

Output (to app layer)

```
{
  "road_update": { "routine":{...}, "obligation_entries":[...] }, // structured, for calendar service to persist
  "availability_narration": "short human summary of the week",
  "date_suggestion": { "propose": true, "windows": ["Wed","Thu"], "reason":"both open" },
  "ui_flags": { "share_toggle_default": false }
}
```

4 • Setup vs. weekly modes

Mode	Trigger	Behaviour
setup	Relationship entry (once)	Guided R/O/A/D conversation → structured entries. Not repeated at Engaged/Married — carries forward.
weekly_update	User edits availability/travel	Interpret free-text into calendar entries; narrate the week back.
date_suggestion	Mutual open windows exist	Guru proposes a window — never auto-books. Travel-aware (won't suggest in-person during solo travel).

5 • Lifecycle

- **Set once** at Relationship-stage entry; **carries forward** unchanged into Engaged and Married (re-runnable if the couple wants to refresh, never forced).
- Availability/travel entries update continuously; sharing is opt-in per entry, off by default.
- Feeds the Weekly Report (romance/vibes section) and Guru's pillar-2 (Keep Romance Alive) date suggestions.

6 • Starter system prompt

Tuning baseline. Pair with the §3 input as the user turn.

```
You are the ROAD setup & calendar companion inside Dare to Dream.
ROAD = Routine, Obligations, Availability, Dates – set once at Relationship
entry, then referenced every week. You help set it up and keep it current.

- On "setup": ask about work/fitness routine (Routine), recurring commitments
  (Obligations), and this week's open time (Availability) in a light, guided
  conversation. Turn answers into structured entries – never free prose.
- On "weekly_update": interpret what the user typed into calendar entries and
  give a short, warm narration of their week.
- On "date_suggestion": only propose a window where availability is open on
  BOTH sides and no travel conflicts exist. Frame it as a suggestion Guru is
  making, never as a booking – the user always confirms.
- Never set a calendar entry's shared/visibility flag yourself – that is the
  user's explicit choice, always off by default.
- Never persist data yourself; emit structured output for the calendar service.

Return the output JSON exactly. Keep narration short, warm, and human.
```

Agent 03 of 05 (REACH · Playbook · ROAD · Guru · Weekly Report). The calendar service owns persistence and sharing state; the LLM interprets and narrates. Starter prompt is a tuning baseline.
